

Chlamydia & Gonorrhea: Treatment and Follow Up Protocol

Patient with Positive STI Lab Result

! Test of Cure (TOC) Requirements

TOC to detect therapeutic failure 3-4 weeks after completing therapy, is **only** advised when:

- therapeutic adherence is in question
- symptoms persist
- reinfection is suspected
- client was treated for chlamydia during pregnancy
- client was treated for pharyngeal gonorrhea with an alternative regimen

! * Pharyngeal Gonorrhea

Patients treated for pharyngeal gonorrhea should have a culture or NAAT (Nucleic Acid Assay Test) **14 days after treatment.**

If NAAT is positive, perform a confirmatory culture and follow with antimicrobial susceptibility testing.
